SUMMARY

Backend developer with 5+ years on Laravel and PHP, mostly in payments, hospitality, and e-commerce. I'm at my best turning a messy real-world process into a system that holds up — I've modeled a hotel's whole operation from meetings with its staff, and turned a balance distributor's tangle of spreadsheets into a real financial ledger. I also do a lot of performance work: getting slow requests off the request thread and onto queues, and clearing out the N+1 queries that pile up as an app grows. Based in Damascus, open to on-site or hybrid roles.

Highlights: Wesal payments app, live across Syria · hotel & villa systems with Syrian tax-authority integration · trained 50+ engineers at Darrebni

SKILLS

Core: PHP 8.x, Laravel, MySQL

Laravel: Eloquent & query optimization, queues & scheduling, stancl/tenancy, nwidart modules, PHPUnit

Architecture: multi-tenant SaaS (DB-per-tenant), modular monoliths, RESTful APIs, SOLID, design patterns

Payments: Stripe / PayPal, queued pipelines, retry & reconciliation flows

Tools: Git, Redis, Docker, CI/CD

EXPERIENCE

Backend Laravel Developer & Team Lead

2025 – Present

Ultra Solutions

- Built the onboarding and licensing service for a multi-tenant restaurant SaaS. Each client runs in its own isolated database (stancl/tenancy), and licenses are checked and enforced automatically, with grace periods and a full backup taken before any client is removed.
- Designed and built a hotel management system end to end, starting from discovery meetings with the hotel's staff. Shipped it as a modular monolith (nwidart, 8 modules) covering reservations, check-in/out, shift handovers with cashbox reconciliation, invoicing, client debts, and Syrian tax-authority integration.
- Adapted the hotel system into a separate villa-rental product where the payment flow runs in reverse: guests pay in advance, bookings move through partial-confirmation states, and the system tracks surpluses and refunds.
- Built the reporting APIs over the core POS and inventory domain, roughly 80 tables spanning orders, stock, and manufactured and semi-manufactured products.
- Added unlock-as-you-go access control and progress tracking to the company's education platform.
- Led a 3-person team: split work into tasks, reviewed code and mentored a junior developer, sanity-checked designs for feasibility, and reported delivery status to management.

Laravel Trainer

2024 – 2025

Darrebni

- Designed and taught a Laravel course to 50+ engineers, from fundamentals through clean code, testing, and building projects as a team.

Laravel Developer

2023 – 2024

TrendDXB (UAE)

- Built the entire backend and API for [Uranus](#), a car-rental booking platform, and led the frontend developer and UI/UX designer working on it.
- Built [Vida-Food](#) end to end: an e-commerce site for a UAE food supplier, including catalog, cart, checkout, and admin dashboard.

Laravel Developer

2022 – 2023

Limitless Group

- Worked on Wesal ([App Store](#), [Google Play](#)), a consumer app for topping up mobile credit and paying bills in Syria.
- Rebuilt the balance-transfer flow, which was slowing down under load: moved it off a single synchronous controller onto a queue and cleared the N+1 queries, noticeably cutting response time for users.
- Added failure recovery for telecom-provider outages — the system flags transactions that were paid but not transferred, retries them on a schedule, and lets support replay any single transfer by hand.

Laravel Developer

2021 – 2022

InSoft Online (Germany)

- Built an internal time-tracking and task tool: tasks and timers per project, per-employee admin reporting, and exportable monthly reports.

Freelance Laravel Developer

2021 – Present

Self-employed

- Trend System — a financial back-office that replaced a mobile-balance distributor's spreadsheets. Tracks bank, cashbox, and shareholder balances, client debts and advances, and Syriatel/MTN transfers routed through the official provider or commissioned sub-providers, with margin tracked per source.
- [Alsafwa](#) — sped up an existing dental-clinic system by removing N+1 queries and trimming the API so it only returns the part of the diagnosis tree currently in use.
- Najeeb — an e-learning platform with role-based access, subscriptions, attendance-based progress tracking, and a lesson calendar.

EDUCATION

Diploma in Software Engineering

2019 – 2021

Damascus University

LANGUAGES

Arabic: native

English: B2 (upper-intermediate)
